METHODS AND THERAPEUTIC COMBINATIONS FOR THE TREATMENT OF XANTHOMA USING STEROL ABSORPTION INHIBITORS

CROSS-REFERENCE TO RELATED APPLICATIONS

This application claims the benefit of priority from U.S. Provisional Patent Application Serial No. 60/323,942, filed September 21, 2001.

FIELD OF THE INVENTION

The present invention relates to methods and therapeutic combinations for treating and preventing xanthomas in a subject including the administration of certain sterol and/or 5 α -stanol absorption inhibitors.

BACKGROUND OF THE INVENTION

Xanthomas are a common skin disorder associated with the accumulation of fatty materials under the surface of the skin. Xanthomas are most commonly associated with those who have high triglyceride and cholesterol levels.

Xanthoma is characterized by a lesion or bump that appears on the surface of the skin. Although the lesions or bumps are usually painless and soft to the touch, they are of a yellow color and may vary in size from very small up to a few inches, making them unsightly. Furthermore, the xanthoma itself may be indicative of an underlying disease such as diabetes, primary biliary cirrhosis, some types of cancer, or hypercholesterolemia.

Xanthomas, which are more specifically, benign fatty tumors, may be removed by surgical means, but if no other treatment is provided, they are likely to reform.

Therefore, there is a need for a method of treating and therapeutic combinations to treat xanthomas that not only reduce the incidence of xanthomas, but also prevent their formation.

SUMMARY OF THE INVENTION

In one embodiment, the present invention provides a method of preventing or decreasing the incidence of xanthomas in a subject comprising the step of administering to a subject in need of such treatment an effective amount of at least one sterol absorption inhibitor, at least one 5 α -stanol absorption inhibitor, or a

- 2 -

pharmaceutically acceptable salt or solvate thereof, to prevent or decrease the incidence of xanthomas in the subject.

In another embodiment, the present invention provides a method of preventing or decreasing the incidence of xanthomas in a subject comprising the step of administering to a subject in need of such treatment an effective amount of at least one sterol and/or 5 α -stanol absorption inhibitor represented by Formulae I-XII below or a pharmaceutically acceptable salt or a solvate thereof to prevent or decrease the incidence of xanthomas in the subject.

Therapeutic combinations also are provided comprising: (a) a first amount of at least one sterol and/or 5 α -stanol absorption inhibitor or a pharmaceutically acceptable salt or a solvate thereof; and (b) a second amount of at least one cholesterol biosynthesis inhibitor, wherein the first amount and the second amount together comprise a therapeutically effective amount for the treatment or prevention of xanthomas in a subject.

Other than in the operating examples, or where otherwise indicated, all numbers expressing quantities of ingredients, reaction conditions, and so forth used in the specification and claims are to be understood as being modified in all instances by the term "about".

DETAILED DESCRIPTION

In one embodiment, the present invention is directed to methods of treating or preventing xanthomas by administering an effective amount of a composition or a therapeutic combination comprising at least one (one or more) sterol absorption inhibitor(s) and/or at least one (one or more) 5 α -stanol absorption inhibitor(s), such as but not limited to, substituted azetidinone or substituted β -lactam sterol absorption inhibitors discussed in detail below.

The term "therapeutically effective amount" means that amount of a therapeutic agent of the composition, such as the sterol and/or 5 α -stanol absorption inhibitor(s) and other pharmacological or therapeutic agents described below, that will elicit a biological or medical response of a tissue, system, or subject that is being sought by the administrator (such as a researcher, doctor or veterinarian) which includes alleviation of the symptoms of the xanthoma condition or disease being treated and

- 3 -

the prevention, slowing or halting of progression of the condition, including but not limited to decreasing the number of xanthomas and/or the size of the xanthomas.

Examples of suitable subjects that can be treated according to the methods of the present invention include mammals, such as humans or dogs, and other animals.

5 As used herein, "combination therapy" or "therapeutic combination" means the administration of two or more therapeutic agents, such as sterol or 5 α -stanol absorption inhibitor(s) and other lipid lowering agents discussed below, such as cholesterol biosynthesis inhibitor(s), to prevent or treat xanthomas. Such administration includes coadministration of these therapeutic agents in a substantially
10 simultaneous manner, such as in a single tablet or capsule having a fixed ratio of active ingredients or in multiple, separate capsules for each therapeutic agent. Also, such administration includes use of each type of therapeutic agent in a sequential manner. In either case, the treatment using the combination therapy will provide beneficial effects in treating xanthomas. A potential advantage of the combination
15 therapy disclosed herein may be a reduction in the required amount of an individual therapeutic compound or the overall total amount of therapeutic compounds that are effective in treating xanthomas. By using a combination of therapeutic agents, the side effects of the individual compounds can be reduced as compared to a monotherapy, which can improve patient compliance. Also, therapeutic agents can be
20 selected to provide a broader range of complimentary effects or complimentary modes of action.

As discussed above, the compositions, pharmaceutical compositions and therapeutic combinations of the present invention comprise one or more sterol absorption inhibitors or 5 α -stanol absorption inhibitors, such as for example
25 substituted azetidinone or substituted β -lactam sterol absorption inhibitors discussed in detail below. As used herein, "sterol absorption inhibitor" means a compound capable of inhibiting the absorption of one or more sterols, including but not limited to cholesterol or phytosterols (such as sitosterol, campesterol, stigmasterol and avenosterol) when administered in a therapeutically effective (sterol absorption
30 inhibiting) amount to a subject. "5 α -stanol absorption inhibitor" means a compound capable of inhibiting the absorption of one or more 5 α -stanols (such as cholestanol, 5 α -campestanol, 5 α -sitostanol) when administered in a therapeutically effective (5 α -

- 4 -

stanol absorption inhibiting) amount to a subject. Mixtures of sterol absorption inhibitor(s) and 5 α -stanol absorption inhibitor(s) also are contemplated.

In a preferred embodiment, sterol or 5 α -stanol absorption inhibitors useful in the compositions, therapeutic combinations and methods of the present invention are represented by Formula (I) below:

 1-3 independently selected substituents.

As used herein, the term "alkyl" or "lower alkyl" means straight or branched
 alkyl chains having from 1 to 6 carbon atoms and "alkoxy" means alkoxy groups
 having 1 to 6 carbon atoms. Non-limiting examples of lower alkyl groups include, for
 example methyl, ethyl, propyl, and butyl groups.

20 "Alkenyl" means straight or branched carbon chains having one or more double
 bonds in the chain, conjugated or unconjugated. Similarly, "alkynyl" means straight or
 branched carbon chains having one or more triple bonds in the chain. Where an alkyl,
 alkenyl or alkynyl chain joins two other variables and is therefore bivalent, the terms
 alkylene, alkenylene and alkynylene are used.

25 "Cycloalkyl" means a saturated carbon ring of 3 to 6 carbon atoms, while
 "cycloalkylene" refers to a corresponding bivalent ring, wherein the points of
 attachment to other groups include all positional isomers.

"Halogeno" refers to fluorine, chlorine, bromine or iodine radicals.

"Aryl" means phenyl, naphthyl, indenyl, tetrahydronaphthyl or indanyl.

- 6 -

"Phenylene" means a bivalent phenyl group, including ortho, meta and para-substitution.

The statements wherein, for example, R, R¹, R² and R³, are said to be independently selected from a group of substituents, mean that R, R¹, R² and R³ are
5 independently selected, but also that where an R, R¹, R² and R³ variable occurs more than once in a molecule, each occurrence is independently selected (e.g., if R is -OR⁶, wherein R⁶ is hydrogen, R² can be -OR⁶ wherein R⁶ is lower alkyl). Those skilled in the art will recognize that the size and nature of the substituent(s) will affect the number of substituents that can be present.

10 Compounds of the invention have at least one asymmetrical carbon atom and therefore all isomers, including enantiomers, stereoisomers, rotamers, tautomers and racemates of the compounds of Formulae I-XII are contemplated as being part of this invention. The invention includes d and l isomers in both pure form and in admixture, including racemic mixtures. Isomers can be prepared using conventional techniques,
15 either by reacting optically pure or optically enriched starting materials or by separating isomers of a compound of the Formulas I-XII. Isomers may also include geometric isomers, e.g., when a double bond is present.

Those skilled in the art will appreciate that for some of the compounds of the Formulas I-XII, one isomer will show greater pharmacological activity than other
20 isomers.

Compounds of the invention with an amino group can form pharmaceutically acceptable salts with organic and inorganic acids. Examples of suitable acids for salt formation are hydrochloric, sulfuric, phosphoric, acetic, citric, oxalic, malonic, salicylic, malic, fumaric, succinic, ascorbic, maleic, methanesulfonic and other mineral and
25 carboxylic acids well known to those in the art. The salt is prepared by contacting the free base form with a sufficient amount of the desired acid to produce a salt. The free base form may be regenerated by treating the salt with a suitable dilute aqueous base solution such as dilute aqueous sodium bicarbonate. The free base form differs from its respective salt form somewhat in certain physical properties, such as solubility in
30 polar solvents, but the salt is otherwise equivalent to its respective free base forms for purposes of the invention.

- 7 -

Certain compounds of the invention are acidic (e.g., those compounds which possess a carboxyl group). These compounds form pharmaceutically acceptable salts with inorganic and organic bases. Examples of such salts are the sodium, potassium, calcium, aluminum, gold and silver salts. Also included are salts formed with pharmaceutically acceptable amines such as ammonia, alkyl amines, hydroxyalkylamines, N-methylglucamine and the like.

As used herein, "solvate" means a molecular or ionic complex of molecules or ions of solvent with those of solute (for example, one or more compounds of Formulae I-XII, isomers of the compounds of Formulae I-XII, or prodrugs of the compounds of Formulae I-XII). Non-limiting examples of useful solvents include polar, protic solvents such as water and/or alcohols (for example methanol).

Prodrugs of the compounds of Formulae I-XII are contemplated as being part of this invention. As used herein, "prodrug" means compounds that are drug precursors which, following administration to a patient, release the drug *in vivo* via some chemical or physiological process (e.g., a prodrug on being brought to the physiological pH or through enzyme action is converted to the desired drug form).

Another useful compound is represented by Formula XII:

XII

The compounds of Formulae I-XII can be prepared by known methods, including the methods discussed above and, for example, WO 93/02048 describes the preparation of compounds wherein -R¹-Q- is alkylene, alkenylene or alkylene interrupted by a hetero atom, phenylene or cycloalkylene; WO 94/17038 describes the preparation of compounds wherein Q is a spirocyclic group; WO 95/08532 describes the preparation of compounds wherein -R¹-Q- is a hydroxy-substituted alkylene group; PCT/US95/03196 describes compounds wherein -R¹-Q- is a

- 43 -

5 The daily dose of the sterol or 5 α -stanol absorption inhibitor(s) administered to the subject can range from about 0.1 to about 1000 mg per day, preferably about 0.25 to about 50 mg/day, and more preferably about 10 mg per day, given in a single dose or 2-4 divided doses. The exact dose, however, is determined by the attending clinician and is dependent on the potency of the compound administered, the age,
10 weight, condition and response of the patient.

For administration of pharmaceutically acceptable salts of the above compounds, the weights indicated above refer to the weight of the acid equivalent or the base equivalent of the therapeutic compound derived from the salt.

The methods, compositions, and therapeutic combinations of the present
15 invention may also include co-administering an effective amount of another therapeutic composition. These therapeutic compositions may include HMG-CoA reductase inhibitors, peroxisome proliferator-activated receptor activators, obesity medications, probucol or derivatives thereof, low-density lipoprotein receptor activators, Omega 3 fatty acids, nicotinic acid or a derivative thereof, Acyl CoA:
20 cholesterol O-acyl transferase inhibitors, natural water solid fibers, plant sterols, plant stanols, fatty acid esters of plant stanols, antioxidants, vitamins, hormone replacements, obesity control agents, diabetes control agents, blood modifiers, cardiovascular agents, other therapeutic agents described below, and combinations thereof.

25 Also useful in the present invention are compositions or therapeutic combinations that further comprise at least one (one or more) activators for peroxisome proliferator-activated receptors (PPAR). The activators act as agonists for the peroxisome proliferator-activated receptors. Three subtypes of PPAR have been identified, and these are designated as peroxisome proliferator-activated receptor
30 alpha (PPAR α), peroxisome proliferator-activated receptor gamma (PPAR γ) and peroxisome proliferator-activated receptor delta (PPAR δ). It should be noted that

- 44 -

PPAR δ is also referred to in the literature as PPAR β and as NUC1, and each of these names refers to the same receptor.

PPAR α regulates the metabolism of lipids. PPAR α is activated by fibrates and a number of medium and long-chain fatty acids, and it is involved in stimulating β -oxidation of fatty acids. The PPAR γ receptor subtypes are involved in activating the program of adipocyte differentiation and are not involved in stimulating peroxisome proliferation in the liver. PPAR δ has been identified as being useful in increasing high density lipoprotein (HDL) levels in humans. See, e.g., WO 97/28149.

PPAR α activator compounds are useful for, among other things, lowering triglycerides, moderately lowering LDL levels and increasing HDL levels. Useful examples of PPAR α activators include fibrates.

Non-limiting examples of suitable fibric acid derivatives ("fibrates") include clofibrate (such as ethyl 2-(p-chlorophenoxy)-2-methyl-propionate, for example ATROMID-S® Capsules which are commercially available from Wyeth-Ayerst); gemfibrozil (such as 5-(2,5-dimethylphenoxy)-2,2-dimethylpentanoic acid, for example LOPID® tablets which are commercially available from Parke Davis); ciprofibrate (C.A.S. Registry No. 52214-84-3, see U.S. Patent No. 3,948,973 which is incorporated herein by reference); bezafibrate (C.A.S. Registry No. 30299-08-2, see U.S. Patent No. 3,716,583 which is incorporated herein by reference); binifibrate (C.A.S. Registry No. 69047-39-8, see BE 884722 which is incorporated herein by reference); lifibrol (C.A.S. Registry No. 96609-16-4); fenofibrate (such as TRICOR® micronized fenofibrate (2-[4-(4-chlorobenzoyl)phenoxy]-2-methyl-propanoic acid, 1-methylethyl ester) which is commercially available from Abbott Laboratories or LIPANTHYL® micronized fenofibrate which is commercially available from Laboratoire Fournier, France) and mixtures thereof. These compounds can be used in a variety of forms, including but not limited to acid form, salt form, racemates, enantiomers, zwitterions and tautomers.

Other examples of PPAR α activators useful in the practice of the present invention include suitable fluorophenyl compounds as disclosed in U.S. No. 6,028,109 which is incorporated herein by reference; certain substituted phenylpropionic compounds as disclosed in WO 00/75103 which is incorporated herein by reference;

Use of bile acid sequestrants is desirable because of their non-systemic mode of action. Bile acid sequestrants can lower intrahepatic cholesterol and promote the synthesis of apo B/E (LDL) receptors which bind LDL from plasma to further reduce cholesterol levels in the blood.

Non-limiting examples of suitable bile acid sequestrants include cholestyramine (a styrene-divinylbenzene copolymer containing quaternary ammonium cationic groups capable of binding bile acids, such as QUESTRAN® or QUESTRAN LIGHT® cholestyramine which are available from Bristol-Myers Squibb), colestipol (a copolymer of diethylenetriamine and 1-chloro-2,3-epoxypropane, such as COLESTID® tablets which are available from Pharmacia), colesevelam hydrochloride (such as WelChol® Tablets (poly(allylamine hydrochloride) cross-linked with epichlorohydrin and alkylated with 1-bromodecane and (6-bromohexyl)-trimethylammonium bromide) which are available from Sankyo), water soluble derivatives such as 3,3'-ioene, N-(cycloalkyl) alkylamines and poliglusam, insoluble quaternized polystyrenes, saponins and mixtures thereof. 20 Mixtures of any of the pharmacological or therapeutic agents described above can be used in the compositions and therapeutic combinations of these other embodiments of the present invention.

 The compositions and therapeutic combinations of the present invention can be administered to a mammal in need of such treatment in a therapeutically effective
25 amount to treat conditions such as xanthomas. The compositions and treatments can be administered by any suitable means that produce contact of these compounds with the site of action in the body, for example in the plasma, liver or small intestine of a mammal or human.

 The daily dosage for the various compositions and therapeutic combinations
30 described above can be administered to a patient in a single dose or in multiple subdoses, as desired. Subdoses can be administered 2 to 6 times per day, for example. Sustained release dosages can be used. Where the sterol absorption

- 59 -

inhibitor(s) and other therapeutic agent are administered in separate dosages, the number of doses of each component given per day may not necessarily be the same, e.g., one component may have a greater duration of activity and will therefore need to be administered less frequently.

5 The compositions, therapeutic combinations or medicaments of the present invention can further comprise one or more pharmaceutically acceptable carriers, one or more excipients and/or one or more additives. The pharmaceutical compositions can comprise about 1 to about 99 weight percent of active ingredient (one or more compounds of Formula I-XII), and preferably about 5 to about 95 percent active
10 ingredient.

Useful pharmaceutically acceptable carriers can be solid, liquid or gas. Non-limiting examples of pharmaceutically acceptable carriers include solids and/or liquids such as magnesium carbonate, magnesium stearate, talc, sugar, lactose, ethanol, glycerol, water and the like. The amount of carrier in the treatment composition or
15 therapeutic combination can range from about 5 to about 99 weight percent of the total weight of the treatment composition or therapeutic combination. Non-limiting examples of suitable pharmaceutically acceptable excipients and additives include non-toxic compatible fillers, binders such as starch, polyvinyl pyrrolidone or cellulose ethers, disintegrants such as sodium starch glycolate, crosslinked polyvinyl
20 pyrrolidone or croscarmellose sodium, buffers, preservatives, anti-oxidants, lubricants, flavorings, thickeners, coloring agents, wetting agents such as sodium lauryl sulfate, emulsifiers and the like. The amount of excipient or additive can range from about 0.1 to about 95 weight percent of the total weight of the treatment composition or therapeutic combination. One skilled in the art would understand that the amount of
25 carrier(s), excipients and additives (if present) can vary. Further examples of pharmaceutically acceptable carriers and methods of manufacture for various compositions can be found in A. Gennaro (ed.), Remington: The Science and Practice of Pharmacy, 20th Edition, (2000), Lippincott Williams & Wilkins, Baltimore, MD.

Useful solid form preparations include powders, tablets, dispersible granules,
30 capsules, cachets and suppositories. An example of a preparation of a preferred solid form dosage formulation is provided below.

- 60 -

Useful liquid form preparations include solutions, suspensions and emulsions. As an example may be mentioned water or water-propylene glycol solutions for parenteral injection or addition of sweeteners and opacifiers for oral solutions, suspensions and emulsions. Liquid form preparations may also include solutions for intranasal administration.

Aerosol preparations suitable for inhalation may include solutions and solids in powder form, which may be in combination with a pharmaceutically acceptable carrier, such as an inert compressed gas, e.g. nitrogen.

Also useful are solid form preparations which are intended to be converted, shortly before use, to liquid form preparations for either oral or parenteral administration. Such liquid forms include solutions, suspensions and emulsions.

The compounds of the invention may also be deliverable transdermally. The transdermal compositions can take the form of creams, lotions, aerosols and/or emulsions and can be included in a transdermal patch of the matrix or reservoir type as are conventional in the art for this purpose.

Preferably the compound is administered orally.

In another embodiment, the present invention provides the use of at least one compound represented by Formulae (I-XII) for manufacture of a medicament (such as one of the compositions discussed above) for the treatment of xanthomas.

Method of Manufacture

5 Mix Item No. 4 with purified water in suitable mixer to form binder solution.
Spray the binder solution and then water over Items 1, 2 and 6 and a portion of item 5
in a fluidized bed processor to granulate the ingredients. Continue fluidization to dry
the damp granules. Screen the dried granule and blend with Item No. 3 and the

For coadministration in separate tablets or capsules, representative
formulations comprising a sterol absorption inhibitor such as are discussed above are
well known in the art and representative formulations comprising an additional
15 treatment such as a cholesterol biosynthesis inhibitor discussed above are well known
in the art. It is contemplated that where the two active ingredients are administered as
a single composition, the dosage forms disclosed above for a sterol absorption
inhibitor may readily be modified using the knowledge of one skilled in the art.

Since the present invention relates to reducing the size or number of
20 xanthomas by treatment with a combination of active ingredients wherein the active
ingredients may be administered separately, the invention also relates to combining
separate pharmaceutical compositions in kit form. That is, a kit is contemplated

- 62 -

wherein two separate units are combined: a pharmaceutical composition comprising at least one sterol absorption inhibitor and a separate pharmaceutical composition comprising at least one additional treatment described above. The kit will preferably include directions for the administration of the separate components. The kit form is particularly advantageous when the separate components must be administered in different dosage forms (e.g., oral and parenteral) or are administered at different dosage intervals.

The treatment compositions and therapeutic combinations of the present invention can prevent or reduce the incidence, size or number of xanthomas, inhibit the intestinal absorption of cholesterol in mammals, and can be useful in the treatment and/or prevention of vascular conditions, such as atherosclerosis, hypercholesterolemia and sitosterolemia, vascular inflammation, stroke, obesity and lowering of plasma levels of cholesterol in subjects, in particular in humans. As used herein, "vascular" means relating to blood vessels, including but not limited to arteries and/or veins, and includes cardiovascular, cerebrovascular, peripheral vascular and combinations thereof.

In another embodiment of the present invention, the compositions and therapeutic combinations of the present invention can reduce xanthomas by reducing plasma concentration of at least one sterol or 5α -stanol selected from the group consisting of phytosterols (such as sitosterol, campesterol, stigmasterol and avenosterol), 5α -stanols (such as cholestanol, 5α -campestanol, 5α -sitostanol), cholesterol and mixtures thereof. The plasma concentration can be reduced by administering to a subject in need of such treatment an effective amount of at least one treatment composition comprising at least one sterol and/or 5α -stanol absorption inhibitor described above or a treatment composition or therapeutic combination comprising at least one sterol or 5α -stanol absorption inhibitor described above. The reduction in plasma concentration of sterols can range from about 1 to about 70 percent, and preferably about 10 to about 50 percent. Methods of measuring serum total blood cholesterol and total LDL cholesterol are well known to those skilled in the art and for example include those disclosed in PCT WO 99/38498 at page 11, incorporated by reference herein. Methods of determining levels of other sterols in serum are disclosed in H. Gylling et al., "Serum Sterols During Stanol Ester Feeding in

- 63 -

a Mildly Hypercholesterolemic Population", J. Lipid Res. 40: 593-600 (1999), incorporated by reference herein.

Illustrating the invention is the following example which, however, is not to be considered as limiting the invention to their details. Unless otherwise indicated, all parts and percentages in the following examples, as well as throughout the specification, are by weight.

EXAMPLE

PREPARATION OF COMPOUND OF FORMULA (II)

Step 1): To a solution of (S)-4-phenyl-2-oxazolidinone (41 g, 0.25 mol) in CH₂Cl₂ (200 ml), was added 4-dimethylaminopyridine (2.5 g, 0.02 mol) and triethylamine (84.7 ml, 0.61 mol) and the reaction mixture was cooled to 0°C. Methyl-4-(chloroformyl)butyrate (50 g, 0.3 mol) was added as a solution in CH₂Cl₂ (375 ml) dropwise over 1 h, and the reaction was allowed to warm to 22°C. After 17 h, water and H₂SO₄ (2N, 100 ml), was added the layers were separated, and the organic layer was washed sequentially with NaOH (10%), NaCl (sat'd) and water. The organic layer was dried over MgSO₄ and concentrated to obtain a semicrystalline product.

Step 2): To a solution of TiCl₄ (18.2 ml, 0.165 mol) in CH₂Cl₂ (600 ml) at 0°C, was added titanium isopropoxide (16.5 ml, 0.055 mol). After 15 min, the product of Step 1 (49.0 g, 0.17 mol) was added as a solution in CH₂Cl₂ (100 ml). After 5 min., diisopropylethylamine (DIPEA) (65.2 ml, 0.37 mol) was added and the reaction mixture was stirred at 0°C for 1 h, the reaction mixture was cooled to -20°C, and 4-benzyloxybenzylidene(4-fluoro)aniline (114.3 g, 0.37 mol) was added as a solid. The reaction mixture was stirred vigorously for 4 h at -20°C, then acetic acid was added as a solution in CH₂Cl₂ dropwise over 15 min, the reaction mixture was allowed to warm to 0°C, and H₂SO₄ (2N) was added. The reaction mixture was stirred an additional 1 h, the layers were separated, washed with water, separated and the organic layer was dried. The crude product was crystallized from ethanol/water to obtain the pure intermediate.

- 64 -

Step 3): To a solution of the product of Step 2 (8.9 g, 14.9 mmol) in toluene (100 ml) at 50°C, was added N,O-bis(trimethylsilyl)acetamide (BSA) (7.50 ml, 30.3 mmol). After 0.5 h, solid TBAF (0.39 g, 1.5 mmol) was added and the reaction mixture stirred at 50°C for an additional 3 h. The reaction mixture was cooled to 22°C, CH₃OH (10 ml), was added. The reaction mixture was washed with HCl (1N), NaHCO₃ (1N) and NaCl (sat'd.), and the organic layer was dried over MgSO₄.

Step 4): To a solution of the product of Step 3 (0.94 g, 2.2 mmol) in CH₃OH (3 ml), was added water (1 ml) and LiOH·H₂O (102 mg, 2.4 mmole). The reaction mixture was stirred at 22°C for 1 h and then additional LiOH·H₂O (54 mg, 1.3 mmole) was added. After a total of 2 h, HCl (1N) and EtOAc was added, the layers were separated, the organic layer was dried and concentrated in *vacuo*. To a solution of the resultant product (0.91 g, 2.2 mmol) in CH₂Cl₂ at 22°C, was added ClCOCOCI (0.29 ml, 3.3 mmol) and the mixture stirred for 16 h. The solvent was removed in *vacuo*.

Step 5): To an efficiently stirred suspension of 4-fluorophenylzinc chloride (4.4 mmol) prepared from 4-fluorophenylmagnesium bromide (1M in THF, 4.4 ml, 4.4 mmol) and ZnCl₂ (0.6 g, 4.4 mmol) at 4°C, was added tetrakis(triphenylphosphine)palladium (0.25 g, 0.21 mmol) followed by the product of Step 4 (0.94 g, 2.2 mmol) as a solution in THF (2 ml). The reaction was stirred for 1 h at 0°C and then for 0.5 h at 22°C. HCl (1N, 5 ml) was added and the mixture was extracted with EtOAc. The organic layer was concentrated to an oil and purified by silica gel chromatography to obtain 1-(4-fluorophenyl)-4(S)-(4-hydroxyphenyl)-3(R)-(3-oxo-3-phenylpropyl)-2-azetidinone:

HRMS calc'd for C₂₄H₁₉F₂NO₃ = 408.1429, found 408.1411.

Step 6): To the product of Step 5 (0.95 g, 1.91 mmol) in THF (3 ml), was added (R)-tetrahydro-1-methyl-3,3-diphenyl-1H,3H-pyrrolo-[1,2-c][1,3,2] oxazaborole (120 mg, 0.43 mmol) and the mixture was cooled to -20°C. After 5 min, borohydride-dimethylsulfide complex (2M in THF, 0.85 ml, 1.7 mmol) was added dropwise over 0.5 h. After a total of 1.5 h, CH₃OH was added followed by HCl (1 N) and the reaction mixture was extracted with EtOAc to obtain 1-(4-fluorophenyl)-3(R)-[3(S)-(4-
